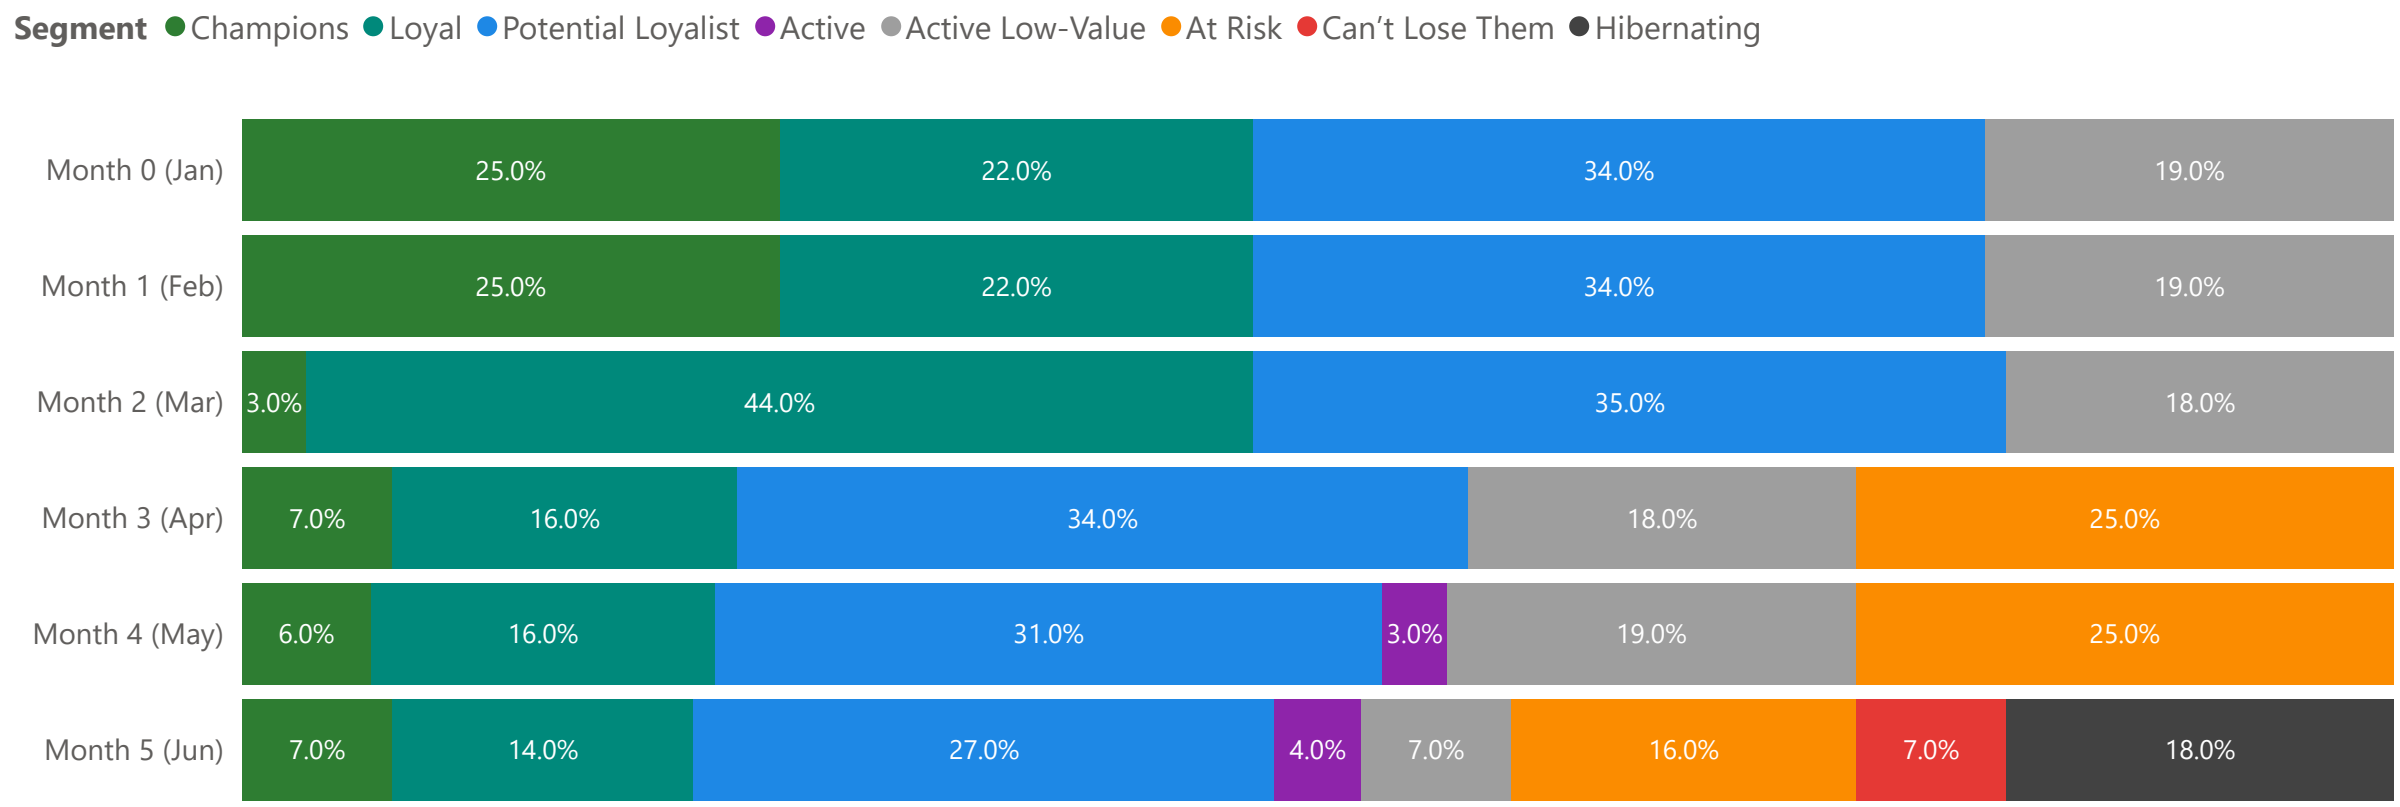
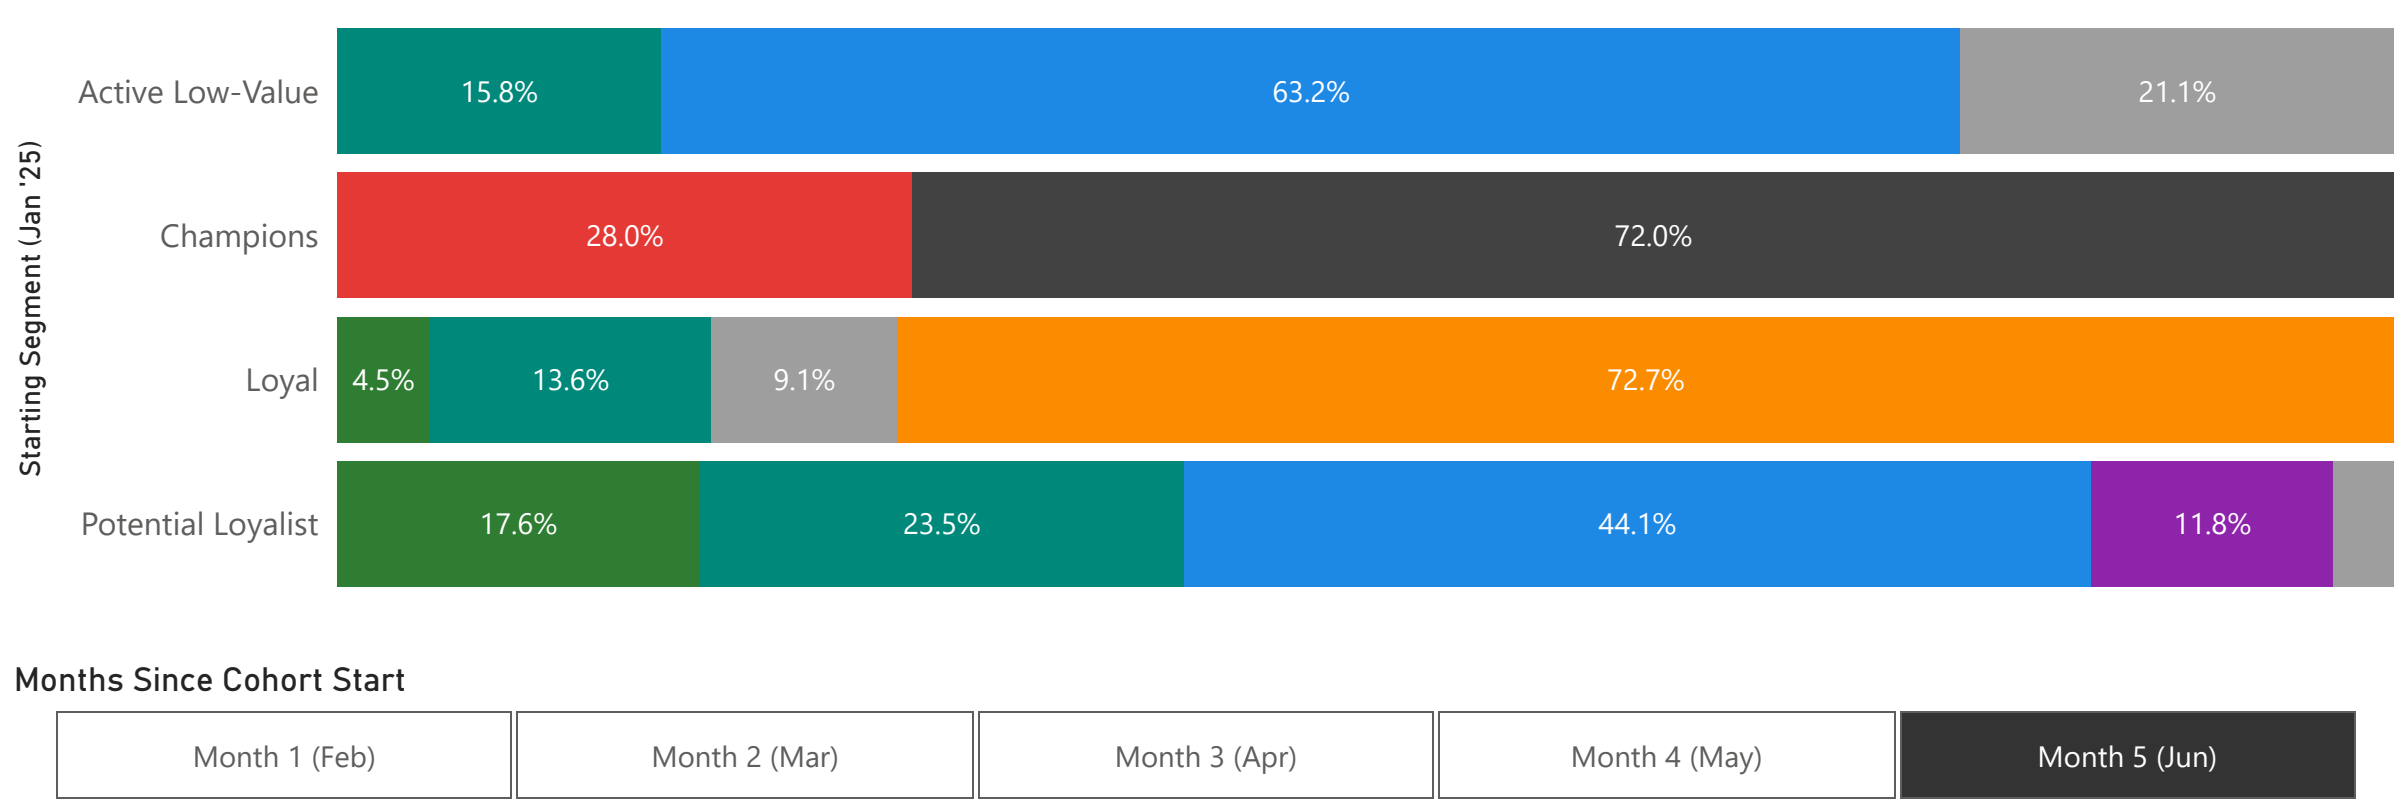
Customer Segment Migration Over Time



Customer Segment Outcomes by Starting Cohort (Jan '25)



General Insights

Customer activity has declined significantly over the last 6 months. Transactions fell from **9.5K in January to 2.2K in June**, while active customers dropped from **100 to 49**, indicating a substantial slowdown in purchasing activity.

Despite the decline in activity, **average order value remained relatively stable**, fluctuating between roughly **2.42M and 2.54M MMK**, suggesting that spending per transaction has remained consistent.

Revenue trends closely follow the decline in transactions and active customers, dropping from **23.5bn MMK in January to 5.7bn MMK in June**, indicating that overall revenue performance is strongly driven by customer activity levels rather than order size.

Regional Insights

Mandalay generates the highest revenue and has the largest number of active customers, indicating it is currently the strongest regional market.

Yangon has the lowest revenue despite having a moderate number of customers, suggesting lower average customer value compared with other regions.

Average order value across regions is relatively similar (around **2.4M–2.5M MMK**), meaning differences in regional revenue are primarily driven by **customer volume rather than spending behavior**.

Revenue share by region has remained relatively balanced over time, indicating **low dependency on a single geographic market**, which reduces geographic revenue risk.

Customer Segmentation Insights

The largest customer group is **Potential Loyalists (26%)**, indicating strong potential to grow the base of high-value customers if engagement strategies are applied effectively.

Hibernating (17%) and At Risk (16%) customers together represent one third of the customer base, highlighting a significant churn risk and opportunity for re-engagement campaigns.

Champions represent only 6% of customers, but they demonstrate the highest purchasing frequency and spending levels, confirming their importance for long-term revenue generation.

Customers in the **Can’t Lose Them segment show very high monetary value but high recency**, indicating valuable customers who have recently become inactive and should be prioritized for retention efforts.

Customer Lifecycle Insights (Cohort Analysis)

Customers initially concentrated in **Potential Loyalist and Loyal segments gradually migrate toward At Risk and Hibernating segments**, suggesting that customer engagement weakens over time without continued interaction.

A portion of customers starting in the **Active Low-Value cohort transition into higher-value segments**, indicating opportunities to increase customer lifetime value through targeted marketing strategies.

Customers beginning in the **Potential Loyalist segment frequently transition into Loyal customers**, confirming this group as the most promising opportunity for customer value growth.

Strategic Recommendations

Prioritize retention of high-value customers, particularly Champions and Loyal customers, through loyalty programs, exclusive offers, and personalized engagement strategies.

Implement re-engagement campaigns targeting At Risk and Can’t Lose Them segments, as these customers previously demonstrated strong purchasing behaviour and represent significant recoverable revenue.

Focus marketing efforts on Potential Loyalists, as this segment shows the strongest potential to transition into high-value segments such as Loyal or Champions.

Increase engagement with Hibernating customers through low-cost reactivation campaigns, such as targeted promotions or reminder communications.

Leverage high-performing regions such as Mandalay as growth hubs, while investigating why customer value is lower in Yangon and identifying opportunities to increase spending per customer.

Monitor customer lifecycle migration regularly, using cohort analysis to detect early signs of churn and intervene before customers transition into inactive segments.
